Subject: Gas Leak Well Head Check , Cellar & Sump Investigation for Oxnard Property located in Oxnard, CA

Dear Clayton:

Buena Resources, Inc. has prepared this Site Report to summarize the field data from the well head gas leakage check, the laboratory data from the ten (10) samples that were taken from the cellar investigation and the results of our attempt to locate any sumps associated with these two oil wells, W13-1A & W13-3. This field work was completed on February 27 & 28 and March 2, 2020.

1.0 SCOPE OF INVESTIGATION:

The intent of this investigation was to: 1) uncover and check the oil well cap and outside annulus of the well casing for methane leakage with a field OVA (organic vapor analyzer, 2) excavate a 10' x 10' area around the well head to a depth of 8' to check for both soil contamination from the oil well operation and concrete remnants from the cellar, 3) provide surveyed coordinates and elevation of the well head and 4) investigate both well sites for the presence of an oil sump associated with the development of the oil wells.

2.0 GAS CHECK:

The well head was checked for leakage by Buena Personnel on February 28, 2020. The well head was checked with a Thermo TVA 1000b OVA. All readings stayed steady at 4.0 ppm, which appears to be background for this immediate area. Testing was witnessed by Justin LaForge, DOGGR Staff Engineering Geologist.

3.0 REMOVAL OF CELLAR CONCRETE:

Both oil wells had the bottom of the cellar present along with some remnants of the side walls of the cellar. Approximately one (1) ten-yard roll-off bin of concrete debris was excavated and shipped to Will Adams concrete recycle facility located west of Santa Maria for recycle.

4.0 SOIL SAMPLING OF CELLAR EXCAVATION**4.1 Oil Well W13-1A**

Oily sands and drilling mud were discovered around the well head during the excavation process. Five (5) 10-yard bins of the crude impacted material were loaded and shipped to Pacific Petroleum's yard, pending profile analysis of the material. Our intent is to profile this material for disposal at the Santa Maria Regional Landfill as non-hazardous petroleum impacted soil.

Samples were taken from each side wall and the excavation bottom of the oil well from visually clean sand. The side wall samples were taken approximately 2' above the bottom of the excavation. The samples were analyzed for full range hydrocarbons (TPH) by EPA method 8015 for gasoline, diesel and motor oil ranges, CAM metals and Volatile Organic Compounds (VOCs). Soil samples taken were grab samples which and were sealed, labeled, placed in a cooler with ice and shipped to the laboratory. Analyses were completed according to the various methods specified according to SW-846 guidelines.

4.2 Oil Well W13-3

No impacted soils were discovered around the well head during the excavation process. All material appeared to be clean sandy soil. Samples were taken from each side wall and the excavation bottom of the oil well from visually clean sand. The side wall samples were taken approximately 2' above the bottom of the excavation. The samples were analyzed for full range hydrocarbons (TPH) by EPA method 8015 for gasoline, diesel and motor oil ranges, CAM metals and Volatile Organic Compounds (VOCs). Soil samples taken were grab samples which and were sealed, labeled, placed in a cooler with ice and shipped to the laboratory. Analyses were completed according to the various methods specified according to SW-846 guidelines.

4.2 Sampling Maintenance and Security

Upon collection, the sample containers were labeled in accordance with EPA protocols and chilled pending transportation to OEC, a State certified analytical laboratory located in Santa

Maria, California following chain-of-custody procedures. All samples were recorded on Chain-of-Custody forms in ink and transferred to the laboratory according to EPA SW-846 protocol. Any changes or corrections were made by drawing a line through the error and initialing and dating the correction, then entering the correct information.

5.0 SUMP INVESTIGATION

Trenches were placed as shown on the attached figures. We utilized an aerial photograph from October 1959 to aid in our trench placement. This photo showed both pad areas oriented in an east-west direction with the likely location at the W3-1A Oil Well on the westside as the pumping unit and tanks appear to be located on the east side. Well W3-3 likely had the access on the west side so the east side was the primary focus. No indication of sump material was found in any of the trenches. It is possible that the farmer requested that the material be removed from the site, as it appears they had lemon or orange trees planted on the property.

6.0 DISCUSSION OF RESULTS:

Gas Check

As noted previously, all OVA results were very low and did not appear to exceed the background level as noted outside the well area. Mr. Justin LaForge, DOGGR Engineering Geologist, supervised the gas check and inspected the well heads.

Soil Sampling Results for Well 13-1A

The excavation sidewalls and bottom did have crude oil impacted soils which were removed along with the concrete bottom of the cellar. Five 10-yard bins of impacted soils were removed and shipped to PPC's yard in Santa Maria, pending profiling to the Santa Maria Regional Landfill. All sampling results for Total Petroleum Hydrocarbons and Volatile Organic Compounds were non-detect or below the method detection limit (MDL). CAM metal results were well below the cleanup thresholds and appear to be typical for background levels in this area.

Soil Sampling Results for Well 13-3

The excavation sidewalls and bottom appeared to be visually clean sandy soil with no visible impacts. The sampling results indicated that the hydrocarbon levels were non-detectable for three of the five samples and with the bottom and west wall reporting diesel level hydrocarbons

at 79 mg/kg and 70 mg/kg, respectively. These two reported levels are below the action level for this diesel range of hydrocarbons. All samples reported no Volatile Organic Compound levels in any of the samples. CAM results were all below action level and typical for background levels for this area.

7.0 CONCLUSIONS:

The site was excavated at the two Oil Well locations, W3-1A & W3-3. Both wells were checked for leakage at the well cap and along the exposed casing with no leaks noted. The area around each well head was excavated to expose at least 3' of the well casing to inspect for contamination and concrete cellar remnants. Both wells had the concrete cellar bottoms present which were removed and shipped to a recycle facility in Santa Maria, California.

Well 13-1A had crude oil impacted soils around the well extending about 7' below the top of the well. This material was removed and shipped to PPC's yard pending profiling for disposal. Confirmation samples were taken from the sidewalls and bottom of the excavation which were all below action levels and the site was backfilled. Well 13-3 had visually clean sidewalls and bottom, so no soils were excavated for disposal. All confirmation samples were below action levels and the site was backfilled.

Both well locations were trenched to at least 7' in various locations as shown of the attached figures to check for the presence of a drilling sump. Despite numerous trenches, no indication of a drilling sump was found at either location. We speculated that the farmer may have requested their removal at the time of the drilling as this was an active orchard. Based on the above results, it is our opinion that there is no further work required at either of these sites.

BUENARESOURCES

Thank you for the opportunity to be of service. If you have any questions, please contact this office at (805) 346-1766.

Sincerely,

Buena Resources, Inc.

Dear Client:

Enclosed is an analytical report for the above referenced project. The samples included in this report were received on February 28, 2020 13:25 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Manual, applicable standard operating procedures, and other related documentation. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

A handwritten signature in black ink that reads "Meredith Sprister".

Notes and Definitions

OTWN	This sample was analyzed outside of the 12 hour tuning window specified in the method.
B-07	The method blank (MB) contains target analyte above the MDL or RL, however the sample result for this analyte is ND. Data is not impacted.
C-01	To reduce matrix interference, the sample extract has undergone sulfuric acid clean-up, method 3665, which is specific to hydrocarbon contamination.
C-06	To reduce matrix interference, the sample extract has undergone pentane clean-up, which is specific to contamination from high molecular weight material (asphaltenes).
CCFL 8081	Target analyte exceeded 15% deviation in bracketing CCV. Per EPA 8081A, calibration was verified by <15% average deviation for all targets. The CCV response for this analyte was low.
CCHI	The CCV for this analyte failed high. Analyte result is ND. Data is not impacted.
D-04	The sample chromatographic pattern does not resemble the fuel standard used for quantitation.
HT-pH	Water pH should be analyzed within 15 minutes of sampling. Soil pH should be analyzed as soon as possible.
>212	>212
J	Detected but below the RL/PQL; therefore, result is an estimated concentration.
TMP3	Temperature [Out-Acceptable] Direct from Field
QL-02	The spike recovery is outside the control limits.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS and/or LCSD recovery and/or RPD values.
QM-12	The spike recoveries for the MS and/or MSD are not available due to sample dilution required from high analyte concentration and/or matrix interference(s).
QR-04	The RPD exceeded the QC control limits.
R-05	The sample was diluted due to the presence of high levels of non-target analytes resulting in elevated reporting limits.
R-07	Reporting limits are at or below state/federal hazardous waste criteria limits.
S-03	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
ISlowA	The internal standard associated with this analyte fails the method criteria on the low side. Results may be biased high.
MDL	Method Detection Limit
RL	Reporting Limit (Quantitation Limit)
ND	Analyte NOT DETECTED at or above the method limit (MDL)
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Statement of Qualifications

STATEMENT OF QUALIFICATIONS

Buena Resources, Inc. is a locally owned and operated full-service environmental company providing environmental consulting, field services and analytical services. Our environmental professionals are experienced in Phase I assessment, Phase II subsurface investigations and Phase III remediation. Our staff consists of professional engineers and environmental technicians. All of our field personnel are OSHA 40 hour trained to perform environmental work when hazardous chemicals are involved. Clients for whom we've performed our services include major oil company, large utilities, industrial facilities, lending institutions, real estate developers and property owners and sellers.

The following professionals performed work related to this project:

Mr. Daniel Ringstmeyer is a Registered Professional Engineer, Colorado and California, Registered Environmental Assessor, Certified OSHA 40-Hour Trained worker, 8-Hour Trained Haz-mat Supervisor and a licensed California General Engineering Contractor. Mr. Ringstmeyer holds a bachelors of science in civil engineering from the South Dakota State University. He is the Founder/Owner and Principal Engineer of **Buena Resources, Inc.** and CIRRUS Environmental, Inc. He is the Principle Engineer responsible for all work performed by the environmental consulting/contracting firm. Mr. Ringstmeyer has conducted Phase I ESA assessments, Phase II subsurface investigations and Phase III remediation projects for sites throughout California and Mexico. He has designed and managed many successful remediation projects utilizing soil vapor extraction/thermal oxidation, bioremediation, groundwater pump and treat, and carbon adsorption throughout California and Mexico including the closure of a large Class I TSD Landfill facility. He has also directly been responsible for the closure of several idled oil fields and illegal agriculture landfills.
